## ***Lean Leaders Continue to Struggle Moving the Needle***

3. Respect the people, language and culture of your own organization.
4. Understand your strengths and weaknesses to drive the right type and level of improvement.
5. Focus on the significant few items required to move the needle.
6. Involve the doers, process and technical experts instead of hiring a bunch of Lean tool experts from the outside.
7. Measure operations' bottom-line improvement rather than measuring progress in implementing tools.
8. Have functional process experts or industrial engineers lead, or be a part of, operational excellence team.
9. Ensure process improvements and changes are easier to do than not to.
10. Align with your current system and/or model and develop one as you go.
